Future
Research

Classifies nearly 100
different species

Business Problem

Flaws of current scouting methods

Invasive species endanger existing ecosystems

- Can be hard to identify
- Fire risk
- Reduce biodiversity
- Easily spread
- Estimated \$120B annually

Data Understanding

Over 400,000 different plant species

- 117 invasive plants in North America
- Over 11,000 images
- Limiting to 96 species
- Provided by Kaggle competitions

Training

Trained a model with thousands of images

- Augment images
- Convolutional Neural Network
- Focus on accuracy improvement

Results

Identifies flowers with 31% accuracy

- Alternative to manual classification
- Stick to trails
- Reduce injury risk

Suggestions

Safely identify plants from remote footage

Scout

Identify

Remove

Future Research

The model has many applications

- Images with different angles
- Recognition with other vegetation
- Fund and train model
